

Skin reactions in the operating theatre:

550 surgeons and nurses gave their perspective

About contact dermatitis:

Contact dermatitis is an inflammation of the skin resulting from direct contact of a substance with the surface of the skin.

The most common form of contact dermatitis is irritant contact dermatitis (ICD), which is caused when substances such as solvents or other chemicals irritate the skin. The exposure produces red, often more painful than itchy, patches on the involved skin areas¹.

ABOUT THE SURVEY:

In December 2019, The SERMO survey polled 555 surgeons and nurses in the United States, United Kingdom, Scandinavia and Japan about their experiences of allergic reactions in the operating theatre.

Introducing Biogel® PI Ultra Touch® S:

Biogel® PI UltraTouch® S surgical glove is our latest innovation; designed with a skin-friendly formula², for clinicians who are experiencing contact dermatitis (irritant or Type IV allergic).

It offers the same precise feeling and performance as our polyisoprene (PI) gloves, but without accelerators known to cause contact dermatitis².
